## Step by step to a beautiful object:

1. Create a free login (e-mail and password)

2. Create object

3. Select one of our sample projects. These are already prepared for the co-
lour scheme.

or:

Upload your own image (jpg format) and start by selecting a shade from the
colour cards and dragging it onto the first colour field. The easiest way to de-
termine an area is to use the «Magic Brush» (lowest menu item on the left).
With the first click in the area you adjust the range using the Diffuser slider
below the image. As soon as the color from the desired area spreads to other
areas, you have to continue with the normal tools like «Line, Brush and Era-
ser» and draw the remaining details of the area. Depending on the image and
contour quality, the «Magic Brush» is sufficient.
To define color areas in another color shade, simply drag another color shade
to the next free space and define the area like the first one. To recolor the de-
fined areas, simply drag a new color tone onto the existing area.

4. The finished image can be saved as a JPEG or PDF file or sent by e-mail
as an export file. In the iOS and Android version on mobile devices, it can al-
so be imported and further processed. The same procedure also works from
the iOS and Android version on mobile devices to the browser version.
By «Save» the current version is left in your account and can be edited later.
